

# SOFTWARE ANALYST

You serve as the conduit between the product owner and the dev/ QA teams. This includes working with the product owner writing requirements to create specs for the dev teams to work from. You help the teams understand what the product owner is asking for.

Conversely, you help the product owner understand limitations, such as why certain requirements will cost too much to do versus an alternative.

## TASKS

- Work with the product owner to define requirements.
- Prepare requirements and write specifications.
- Document existing and new requirements.
- Translate technical issues for product owner.
- Provide clarification on requirements for the development teams.
- Translate the needs of the users to software developers.
- Checks if the software developers implemented the code correctly.

## SKILLS

- Have working knowledge of software technology.
- Software development experience.
- General business knowledge.
- Problem solving and problem reduction skills.
- Interpersonal relation skills.
- Flexibility and adaptability.
- At least 2 years analyst experience or a proven development track record.
